

While exploring the Codex SDK, I wanted to test its limits.

So I tried to make a game with #Codex and ChatGPT, and I made ChatGPT the brain of the game.

I initially started by generating designs and story with the AI.

Players can discuss a battle plan with their allies.

Players can use natural language to talk through a strategy with their team. Codex replies and turns the discussion into orders that guide the characters during battle.

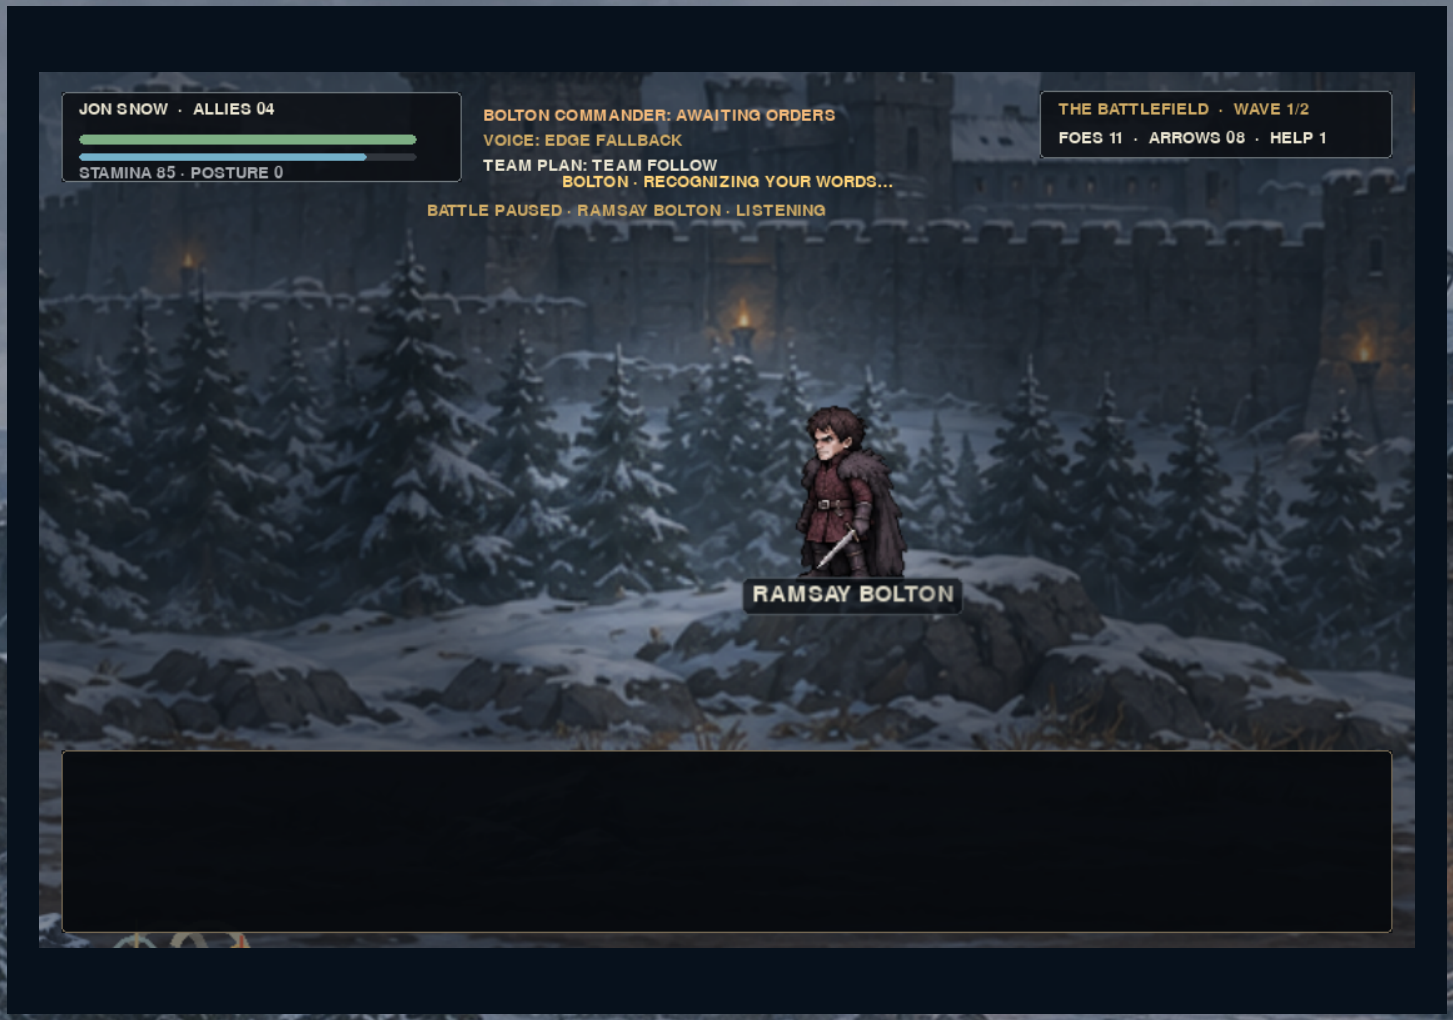

I'm still tweaking how this works.

Players can give their team commands during battle.

Players can press T and speak naturally. Codex translates a few short commands into movement orders, and the team follows along. Other requests are not supported yet.

I'm still working on this.

Codex also controls the enemy.

Players can press E to talk with the enemy commander during battle.

I’m still working on this interaction too.

Do you have an idea that could make it better?

The GitHub repository link is in the comments.

Comment with any ideas you have for improving the game.
